1 System Overview

1.1 Functional Block Diagram

MT7975N is an IEEE 802.11ax 4x4 MIMO and Wi-Fi chip which contains 2.4 GHz Wi-Fi transceiver front-ends in a DRQFN package. Spectrum Monitor (SM) receivers is included to support coexist with other 2.4G WIFI systems. Simplified block diagram and how MT7975N is used are shown in [Figure 1-1](#). The top control logics control each subsystem independently. Each subsystem also has dedicated LDOs. A thermal sensor and a low-speed ADC (Analog-to-Digital Converter) are provided to monitor MT7975N's temperature variation. MT7975N have its dedicated crystal oscillator (XO) circuit. Besides, XO circuit provides an external clock source to other chips in the platform.

The transceiver front-ends are on MT7975N while the ADC/DAC (Analog-to-Digital Converter/Digital-to-Analog Converter) is in the companion modem chip. The interface drivers/receiver buffers are designed to drive PCB trace loading.

MT7975N exhibits the following new features: (1) WiFi 2.4GHz support MIMO 11ax. (2) Dedicated 2.4GHz Spectrum-Monitor (SM) receiver to monitor environment without throughput degradation.

3.4.3 Protocols

There are three main interfaces for MT7975N:

- 2-wire top control interface: Generally used for all systems (BT/Wi-Fi)
- 9-wire bus: High-speed interface, for Wi-Fi
- 2-wire BT control interface: Dedicated used for BT control

3.4.3.1 2-Wire

The 2-wire bus of MT7975N is mainly used as below:

- Top control interface, the main interface to access Wi-Fi/BT/TOP command registers
- BT control interface, dedicated used for BT control

The bit number of SDATA depends on different operating conditions, as shown in [Figure 3-3](#).

Figure 3-3. 2-wire SPI timing diagram

3.4.3.2 9-bit Bus

MT7975N has a dedicated 9-bit bus to control the Wi-Fi radio. The related control definitions depend on operating modes and conditions. The protocol is shown in [Figure 3-4](#).

Figure 3-4. Wi-Fi 9-wire SPI access

3.5 MT7975N TOP Building Blocks

3.5.1 Thermal ADC

A low-speed ADC converts the output of thermal sensor. The temperature coverage range is between -40°C and 120°C. The chip top control may do corresponding adjustment (such as PA/TX gain switching) based on such temperature information.

3.6 Wi-Fi

MT7975N Wi-Fi is a high performance and highly-integrated G-band RF transceiver fully compliant with IEEE 802.11 a/ac/ax/b/g/n standards. A novel RF front-end topology is implemented to achieve 2.4GHz Wi-Fi with integrated TR-switches. MT7975N also features a self-calibration scheme to compensate the process and temperature variation to maintain high performance. The calibration is performed automatically right after the system boot-up.

3.6.1 2.4GHz Wi-Fi Tx

The 2.4G transmitter utilizes the most cost efficient direct up architecture and integrates a high performance PA with on-chip balun. 2.4GHz WiFi Tx share RFIO port with 2.4GHz WiFi Rx by integrating on-chip T/R switch. The data are digitally modulated in the baseband processor from the companion chip, then up-converted to 2.4GHz RF channels through the DA converter, filter, IQ up-converter and power amplifier.

3.6.2 2.4GHz Wi-Fi Rx

Direct down-conversion receiver architecture is also used in 2.4G Wi-Fi Rx, which consists of a high linearity, low noise figure single-ended LNA with on-chip integrated T/R switch, a quadrature passive mixer and a bandwidth-programmable low-pass filter with DC offset cancellation embedded.

3.6.3 2.4GHz Wi-Fi Sx

A fractional-N frequency synthesizer is implemented to support Wi-Fi LO signal. The frequency synthesizer is capable of supporting various crystal clock frequencies. VCO operates at different freq from RF frequency to avoid any coupling with RF front-end circuitry. An LO generation is employed to divide the VCO signal and generate I/Q quadrature signals.
